### DESCRIPTION

Heat is the solution trusted by professionals to eradicate bed bugs. Heat is a simple and reliable solution for peace of mind.

Professional heat treatments can also cost thousands of dollars, displace you from your home for hours, and they create an unpleasant spectacle at your home or business. They are one-time events, and they may be overkill for mild infestations

A ZappBug heat chamber provides a commercial-level solution in a portable package for a fraction of the price.

Heat kills bed bugs, even eggs

Easy to use: Set up, load with items, press on

Treats large, stores small, heat's it all

Durable internal frame, 50% more capacity per load than the competition

 **Fast Discrete**  
Shipping

 **One Year Warranty**

### GOOD FOR

### SPECS

## A necessity if you have bed bug infestation recommended for all travelers

"This has been a very good investment. We had the unfortunate experience of getting bed bugs and this was a critical tool in having piece of mind that every thing we owned could be debugged. It is a must if you have this horrible thing happen to you. We put all items we owned in this. Worked better and every thing can't be tossed in the dryer. Heat is the only thing that kills these horrendous creatures We use it now as a preventative measure. When return from travels all suitcases and contents go thr the zapper as soon as we walk in the door" -Pat

Heat Only

Uses Thermal Heat Technology to Kill Pests

Easily Folds Flat for Convenient Storage

Free and Reliable Customer Support

## Treats large, stores small, heat's it all

ZappBug heat chambers can be quickly deployed or stored by a single person. Protect your home from future infestations by treating luggage when you return from traveling, a child's backpack, or blankets and pillows.

## A solution for eggs...

Bed bug eggs are even more difficult to destroy. However, numerous studies have confirmed that heat is a reliable method for controlling bed bugs and their eggs.

## Use at Home

ZappBug chambers simply heat the air that's already in your home to temperatures guaranteed to eliminate pests. Fortunately, numerous studies have independently confirmed that heat is lethal to all bed bugs and their eggs regardless of life stage.

## Customer Reviews

Based on 44 reviews [Write a review](#)

**Totally works. Killed my little hitchhikers from a trip to Croatia.**

**Amazon Customer** on Sep 29, 2022

Suspected bedbugs from a hotel room. Bought this heater and baked my bags before bringing them inside. It worked. One of the little bedbugs crawled out and died. Glad I used this contraption.

**Could use clearer controls**

**JL Baker** on Jul 30, 2022

Easy to use and set up. It can be difficult to which timing indicator is selected.

[Report as inappropriate](#)

**It took quite some time to warm up to desired temperature with a full appropriate level.**

**Carla Trecek** on Jun 04, 2022

I used this product for books, pillows, quilts, bags, drawers, pictures, etc. It took up to 2 hours to heat to desired temperature with dense objects, like books. So I would set it for four hours then reset for one hour after I saw that it had reached killing temperature.

**High Quality and Very Impressive/Thorough Instructions**

**Brett M.** on May 31, 2022

I've only run one "load" of stuff through this as we continue our battle to eliminate clothes/carpet moths, but I must say I am impressed by the quality of the product and the very high level of effort put into the instructions to "idiot-proof" this for the end-user.

It definitely pulls some electricity so be sure to be careful in selecting which outlets you use... I chose a dedicated 20-amp circuit in my basement that typically runs the dehumidifier and made sure that this was the only draw on the circuit.

**Do exactly and instructions say and it works**

**Bradley b.** on Apr 10, 2022

I was skeptical because of the reviews. I also don't have bed bugs. Carpet beetles -> shoes -> socks -> pants and so on. Dryers don't work because if you think of a black hole with an event horizon where everything in the black hole dies but everything outside of the event horizon lives, bugs will go to the pheromones and the heat and all it takes is a few bugs just around the corner to hop into the black hole just at the right time before the dryer turns off and so not long enough to kill them...and they spread. Now it
